Natural Resources Conservation Service

Ecological Site Description

Site Type: Rangeland

Site Name: Rocky Hills (RH) 15-19" Northern Plains Precipitation Zone,

Site ID: 043BY434WY

Major Land Resource Area: 43B – Central Rocky Mountains

Physiographic Features

This site will usually occur in an upland position on moderate to steep slopes.

Landform: Hill sides, alluvial fans, ridges & stream terraces **Aspect:** N/A

	Minimum	Maximum
Elevation (feet):	3700	7500
Slope (percent):	0	60
Water Table Depth (inches):	None within 60 inches	
Flooding:		
Frequency:	None	None
Duration:	None	None
Ponding:		
Depth (inches):	0	0
Frequency:	None	None
Duration:	None	None
Runoff Class:	negligible	high

Climatic features

Annual precipitation ranges from 15" to 19" per year. May is generally the wettest month. July, August and September are somewhat drier with daily amounts rarely exceeding one inch. Snowfall is quite heavy in the mountainous area. Annual snowfall averages close to 70 inches.

Sunshine is abundant in the latter part of the summer, the greatest amount being in July and August. Sunshine possibility during these two months averages 70 to 75% possibility with only a 65% possibility for June and September. Winter averages about 40% sunshine.

Because of the varied topography, the wind will vary considerably for different parts of the area. The wind is usually much lighter at the lower elevations and in the valleys as compared with the higher terrain. The average winter wind velocity is 8.5 mph, while the summer wind velocity averages 7.5 mph. Winds during storms and on ridges may exceed 45 mph.

Temperatures show a wide range between summer and winter, and between daily maximums and minimums. Summer nights are cool and temperatures drop into the forties at most places before sunrise. Summer daytime temperatures are usually in the seventies and occasionally reach eighty, but rarely reach the mid nineties. Winters are cold with daily lows below freezing most of the time.

January has the coldest temperatures with a range of near 10 deg. F at night to the mid thirties in the afternoon. Temperatures of well below zero to –30 deg. F are not uncommon in the winter months.

The growing season for the cool season plants will generally start about April 15 to May 1 and continue to about October 10.

The following information is from the "Sheridan Airport" climate station:
Frost-free period (32 °F): 95-156 days; (5 yrs. out of 10, these days will occur between May 21 – September 19)
Freeze-free period 28 °F): 116-187 days; (5 yrs. out of 10, these days will occur between May 4 – September 29)
Mean annual precipitation: 14.7 inches
Mean annual air temperature: 45.0 °F (31.2 °F Avg. Min. – 58.8 °F Avg. Max.)

For detailed information visit the Natural Resources Conservation Service National Water and Climate Center at http://www.wcc.nrcs.usda.gov/ website. Other climate station(s) representative of this precipitation zone include: "Parkman 5 WNW"

Influencing Water Features

Wetland Description:	**System**	**Subsystem**	**Class**	**Sub-class**
None	None	None	None	None

Stream Type: None

Representative Soil Features

These soils are shallow, well drained, sandy, and loamy underlain by soft calcareous materials, with many outcrops of sedimentary bedrock. Deep pockets of soil may occur between the outcrops of bedrock.

Parent Material Kind: alluvium and residuum
Parent Material Origin: sandstone, shale, unconsolidated conglomerate
Surface Texture: loam, silt loam, very fine sandy loam
Surface Texture Modifier: none is most common but gravelly or cobbly may occur
Subsurface Texture Group: loam
Surface Fragments ≤ 3" (% Cover): 0 to 20
Surface Fragments > 3" (%Cover): 0 to 20
Subsurface Fragments ≤ 3" (% Volume): typically 0 to 15, occasionally 35 to 75
Subsurface Fragments > 3" (% Volume): typically 0, occasionally 5 to 25

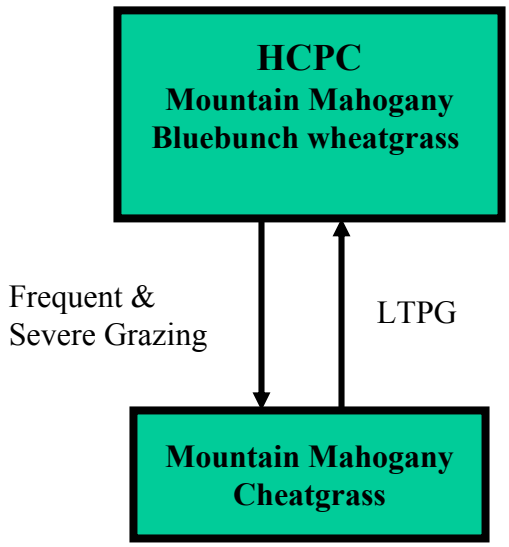
	Minimum	**Maximum**
Drainage Class:	well	excessive
Permeability Class:	slow	very rapid
Depth (inches):	0	10
Electrical Conductivity (mmhos/cm) ≤20":	0	4
Sodium Absorption Ratio ≤20":	0	5
Soil Reaction (1:1 Water) ≤20":	6.6	9.0
Soil Reaction (0.1M CaCl2) ≤20":	NA	NA
Available Water Capacity (inches) ≤30":	0.3	2.0
Calcium Carbonate Equivalent (percent) ≤20":	0	35

Plant Communities

Ecological Dynamics of the Site: As this site deteriorates from improper grazing management, species such as Sandberg bluegrass and bare ground will increase. Species such as cheatgrass will invade. Mountain mahogany will become shorter and assume a hedged look. Cool season grasses such as bluebunch wheatgrass, spike fescue, western wheatgrass and Columbia needlegrass will decrease in frequency and production.

The Historic Climax Plant Community (description follows the plant community diagram) has been determined by study of rangeland relic areas, or areas protected from excessive disturbance. Trends in plant communities going from heavily grazed areas to lightly grazed areas, seasonal use pastures, and historical accounts have also been used.

The following is a State and Transition Model Diagram that illustrates the common plant communities (states) that can occur on the site and the transitions between these communities. The ecological processes will be discussed in more detail in the plant community narratives following the diagram.



BM - Brush Management (fire, chemical, mechanical)
Freq. & Severe Grazing - Frequent and Severe Utilization of the Cool-season Mid-grasses during the Growing Season
GLMT - Grazing Land Mechanical Treatment
LTPG - Long-tem Prescribed Grazing
MCSLG - Moderate, Continuous Season-long Grazing
NU, NF - No Use and No Fire
PG - Prescribed Grazing (proper stocking rates with adequate recovery periods during the growing season)
VLTPG - Very Long-term Prescribed Grazing (could possibly take generations)
Na - found adjacent to a saline site

Plant Community Composition and Group Annual Production

This list of plants and their relative proportions are based on near normal years. Fluctuations in species composition and relative production may change from year to year dependent upon precipitation or other climatic factors.

Plant Community Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they probably are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more data is collected, some of these plant communities may be revised or removed, and new ones may be added. None of these plant communities should necessarily be thought of as "Desired Plant Communities". According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC's) will be determined by the decision-makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

Mountain Mahogany/ Bluebunch Wheatgrass Plant Community

The interpretive plant community for this site is the Historic Climax Plant Community. This site evolved with grazing by large herbivores and is well suited for grazing by wildlife and provides limited summer and fall grazing for domestic livestock. This state is critical winter habitat for mule deer and elk. Potential vegetation is about 45% grasses or grass-like plants, 10% forbs, and 45% woody plants. The state is dominated by mountain mahogany which may have up to 50% canopy cover. Other shrubs on this state may be big sagebrush, rubber rabbitbrush skunkbush sumac, juniper and ponderosa pine. The major grasses include bluebunch wheatgrass, rhizomatous wheatgrasses, Columbia needlegrass and spike fescue. Other grasses occurring on the site include prairie junegrass, Canby bluegrass, Sandberg bluegrass, needleandthread and threadleaf sedge.

Annual production on this state ranges from 600 to 1000 pounds depending on climatic conditions.

The following is the growth curve of this plant community expected during a normal year:
Growth curve number:
Growth curve name:
Growth curve description:

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	10	30	35	10	5	5	5	0	0

(Monthly percentages of total annual growth)

This plant community is extremely stable and well adapted to the Northern Great Plains climatic conditions. The diversity in plant species allows for high drought tolerance. This is a sustainable plant community (site/soil stability, watershed function, and biologic integrity).

Transitions or pathways leading to other plant communities are as follows:

- Heavy, continuous improper grazing will convert the plant community to *the Mountain magogany/CheatgrassVegetation State*

Mountain Mahogany/Cheatgrass

Historically, this plant community evolved under grazing by mule deer and elk. Currently, it is found under heavy winter long browsing by wildlife and heavy spring and summer use by domestic livestock. Mountain mahogany, broom snakeweed and cheatgrass are significant components of this plant community. Annual grasses make up the majority of the understory with the balance made up of perennial cool-season grasses, and miscellaneous forbs. Forbs are common in this plant community, and include western yarrow, field chickweed, hairy goldaster, eriogonums, ballhead sandwort, fringed sagewort and phlox. Plains pricklypear and winterfat can also occur.

When compared to the Historical Climax Plant Community, cryptograms and bare ground have increased. Bluebunch wheatgrass, spike fescue and Columbia needlegrass have decreased, often occurring only where protected from grazing by the woody canopy. Production of cool-season grasses has also been reduced. Cheatgrass (downy brome) has invaded the site.

Annual production ranges from 500 to 800 pounds

The following is the growth curve of this plant community expected during a normal year:
Growth curve number:
Growth curve name:
Growth curve description:

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	10	30	35	10	5	5	5	0	0

(Monthly percentages of total annual growth)

The site is at risk for excessive erosion. The biotic integrity of this plant community is usually intact. However, it can be at risk depending on how far a shift has occurred in plant composition toward juniper, sagebrush, and/or cheatgrass. The watershed is usually functioning. However, it can become at risk when canopy cover of juniper, sagebrush, cheatgrass, and/or bare ground increases.

Transitions or pathways leading to other plant communities are as follows:

- Proper Grazing Management over the long-term will return this state to near *Historic Climax Plant Community*

Ecological Site Interpretations

Animal Community – Wildlife Interpretations

Mountain Mahogany/Bluebunch Wheatgrass Plant Community (HCPC):
The combination of an overstory of mountain mahogany and an understory of grasses and forbs provide a very diverse plant community for wildlife. Due to the location of these sites on the foot slopes of mountains they are valuable for elk and deer winter ranges. Chinook winds often leave these sites clear of snow much of the winter.

Mountain Mahogany/Cheatgrass: The overstory of mountain mahogany provides valuable winter range for deer and elk. Due to the location of these sites on the foot slopes of mountains they are valuable for elk and deer winter ranges. Chinook winds often leave these sites clear of snow much of the winter.

Animal Preferences (Quarterly - 1,2,3,4) for commonly occuring plants in MLRA 43B, 15-19 inch Northern Plains

Animal Community – Grazing Interpretations

The following table lists suggested stocking rates for cattle under continuous season-long grazing under normal growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of the conservation planning process. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this, a field visit is recommended, in all cases, to document plant composition and production. More precise carrying capacity estimates should eventually be calculated using this information along with animal preference data, particularly when grazers other than cattle are involved. Under more intensive grazing management, improved harvest efficiencies can result in an increased carrying capacity. If distribution problems occur, stocking rates must be reduced to maintain plant health and vigor.

Plant Community	Production (Lb./ac)	Carrying Capacity* (AUM/ac)
Mountain Mahogany/Bluebunch Wheatgrass	600-1000	.4
Mountain Mahogany/Cheatgrass	500-800	.2

* - Continuous, season-long grazing by cattle under average growing conditions.

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage for cattle, sheep, or horses. During the dormant period, the forage for livestock use needs to be supplemented with protein because the quality does not meet minimum livestock requirements.

Hydrology Functions

Water is the principal factor limiting forage production on this site. This site is highly variable and is dominated by soils in hydrologic group B and C, with localized areas in hydrologic group D. Infiltration ranges from slow to very rapid. Runoff potential for this site varies from moderate to high depending on soil hydrologic group, slope and ground cover. Areas where ground cover is less than 50% have the greatest potential to have reduced infiltration and higher runoff (refer to Part 630, NRCS National Engineering Handbook for detailed hydrology information.)

Rills and gullies may be present, but should be small. Water flow patterns should be barely distinguishable. Pedestals are only slightly present in association with bunchgrasses such as bluebunch wheatgrass. Litter typically falls in place, and signs of movement are not common. Chemical and physical crusts are rare to non-existent. Cryptogamic crusts are present, but only cover 1-2% of the soil surface.

Recreational Uses

This site provides hunting opportunities for upland game species. The wide variety of plants which bloom from spring until fall have an esthetic value that appeals to visitors.

Wood Products

No appreciable wood products are present on the site.

Other Products
None noted.
